Hi Ko and Muping,

When can we meet? Please do try to get the best fit in Method 1 before we meet.

Try decreasing the size of the intervals when CurlyR_i is large so that the $\text{CurlyR}_{\{ij\}}$ have all the same size. This should solve the numerical problem at high energy, if it was due to having larger R_{ij} .

Maybe it is best if we **add this method in an appendix**- showing it as an alternative that we did not pursue, but we show just the best fit for. So we solve the numerical problem we had remaining at high energy instead of "evading" it.

The paper will be more complete since Method 1 would be the **exact analogue of what is done in the Dark Matter analogue problem.**

Best,

Graciela
