Danny: Your sentence in Sec 5 negates our whole physical motivation, which justifies
YOU CANNOT GO TO j higher than 2MeV.

So you need to say which procedure are you referring to that went to higher energies?
Explain well why you could not stabilize? What was the reason you could not? If it was a numerical error why you did not correct it instead of giving a bogus physical explanation?

there is absolutely NO REASON for the method to fail to "stabilize". The error was in our numerical minimization.

First we have to agree that stabilizing the step structure was one of the reasons for truncating R_i at 2 MeV. You may have forgotten this issue, but I want confirmation from Ko and Muping.

We had many previous numerical problems of not finding steps at ANY energy. maybe you did not follow those earlier ones? They were all numerical issues.

Danny: See colored text. Add all explanations necessary for your statement --- work with Ko and Muping to clearly define the problem you mention of "not stabilization" or whatever it is (I think we did not find steps, which happened earlier at all energies and was a minimization numerical error). Or otherwise, remove it since your sentence does not make sense as it is.
